

## **NANO TECHNOLOGY:-**

- It is the study of controlling & manipulating matter on an atomic or molecular scale.
- It deals with structures the size of 100 Nano meters or smaller in at least one dimension.
- Very diverse Technology & has potential to change the world.

## **TYPES OF NANO PARTICLES:-**

Naturally - Viruses

- Sea spray

- Mineral composite

- Volcanic ash

Incidental - Cooking smoke

- Diesel exhaust

Engineered - Metals

- Quantum dots

- Bucky balls

- 
- Advantages:-**
1. Time controlled
  2. Spatially targetted
  3. Self regulated
  4. Remotely regulated
  5. Pre-programmed

- Applications:-**
1. Anti microbial property
  2. Early detection of cancer
  3. Imaging of Nano particles
  4. Quantum dots of cancer detection
  5. Hybridized DNA
  6. Nanobar code
  7. Nano chips
- 

## ANTI-MICROBIAL PROPERTY:-

- Silver nano particles show efficient anti microbial property compared to other salts.
- Most effective on E-coli, S.aureus, Klebisella, Pseudomonas.
- Non- particle preferably attack on respiratory chain, cell division leading to death.
- **STEM:-** Confirms presence of silver in the cell membrane & inside bacteria.

## EARLY DETECTION OF CANCER:-

- Current systems are limited by their selectivity & efficiency to concentrate rare cells for molecular assays.
- Nano cells can detect circulating cancer cells which present often 1-2 cells per mm of blood.
- Bionanobar codes, Nanocantilevers, Nanowires are used for promising technologies.

## **NANO BARCODE:-**

- Cancer cell detection.
- Protein & nucleic acid detection based on barcode.
- Hybridized bar codes on DNA are removed.
- Bar codes are detected by colorimetric method.

## **QUANTUM DOTS:-**

- Quantum dots staining provides localization information.
- These probes are delivered to tumors by passive targeting mechanism & active targeting mechanism.
- For active tumor targeting used antibody conjugated quantum dots to target a specific membrane antigen.
- Used also in cancer detection.

## **SMART DRUG DELIVERY SYSTEM:-**

- Development of smart treatment delivery systems on nano scale uses similar concepts at molecular level.
- It contain small,sealed packages of drug to be delivered.
- Packages are not opened until they reach desired location i.e.,sites infection.

## ● **HYBRIDIZED DNA FLOUROSCENCE:-**

- Detect an relayed back to an on board system through platinum wiring.

## **NANO CHIPS:-**

Employs the power of electronic current that seperates DNA probes to specific site based on charge & size

## **APPLICATION IN SURGERY:-**

- Instead of damaging a large animal body, these instruments would be precise & accurate, targeting only area where surgery should be done.
- Visualisation of surgery can be improved.
- Less chance of mistakes or faults.
- Surgery can be done on tissue genetic & cellular levels.

## **APPLICATION IN MEDICAL ROBOTICS:-**

- Early diagnosis
- Targeted drug delivery for cancer
- Monitoring diabetes
- Health care

## **APPLICATION TO ANIMAL HEALTH:-**

- Nanotechnology application in molecular biology, biotechnology & almost all disciplines of veterinary & animal sciences.
- Excellence in animal health & production can be achieved by translation of newer technology to create effective services.
- Ability to manufacture & manipulate materials on the nano scale has offered opportunities for application in diverse areas of animal sciences.
- Nano sensor, Nano vaccines, adjuvants, gene delivery & smart drug delivery.
- Disease diagnosis
- Treatment
- Animal nutrition
- Animal breeding, reproduction & tissue engineering
- Drug discovery
- Adds value to animal products

**THANK YOU**
